Abstract

Coastal and sea nature management is considered as a kind of the contact structures formed in the interaction zone of the land and marine types of nature management. The features and substantiations of the borders of a coastal zone, composition of its nature-resource potential, including the resource properties of coastal structures, are distinguished. Combination of quantitative parameters for estimation of aqua-territorial structures of nature management is offered.

Keywords: aqua-territorial structures, coastal and sea nature management, quantitative estimations
